

Spot the difference

Remember to check your skin regularly.

See your doctor if you notice a freckle, mole or lump that is **NEW** or **CHANGING** in size, shape or colour.

See your doctor if you notice a freckle, mole or lump that is **NEW** or **CHANGING** in size, shape or colour; or a sore that does not heal over 4-6 weeks. Use a mirror to check hard to see places, like your back or scalp, or get a family member, partner or friend to check for you.

This is intended as a guide only – consult your doctor regarding any concerning spots or unusual changes.

Protect yourself in **five ways** from skin cancer

Spot the difference

Check your skin for changed spots, or new and changing spots. Even if a spot you are concerned about does not look like the ones in these pictures you should still visit your doctor.

- Most common skin cancer
- May appear as a pearly-coloured lump or as a slightly scaly area that is shiny and pale or bright pink in colour. Some have a darker colour
- It may bleed and be sore. Some heal then get sore again
- Usually on the head, face, neck, shoulders, back, lower arms and lower legs, but can occur anywhere on the body
- Tend to grow slowly over months and years

- Second most common skin cancer
- A thickened red, scaly or crusted spot or rapidly growing lump
- May bleed and be sore. Is often tender to touch
- Appears on parts of body most often exposed to the sun
- Tends to grow over a few weeks or months
- Is more common as you get older

- A dangerous skin cancer
- Can be anywhere on the body. Likely to spread to other parts of the body if not found early
- May appear as:
 - a new spot
 - an existing spot, freckle or mole that changes colour, size, shape or texture
- Usually has an irregular or smudged shape
- May be more than one colour
- Grows quickly over weeks to months

- Is usually red, pink, black or brown and feels firm to the touch. Often appears as a round raised lump on the surface of the skin
- It may bleed or develop a crusty surface
- Fast growing and aggressive

Keep an eye on these, and visit your doctor if you notice any changes.

Freckles

Most freckles are common and harmless. If you have a freckle that is changing in colour or shape it is very important to show your doctor.

Moles

Having many moles may increase the chances of developing a melanoma. Watch for changes in:

- Size
- Colour, including pink/white/brown/blue or black colours
- Shape
- Texture, such as becoming raised or dome shaped, scaly, bleeding or itching

Seborrhoeic Keratosis

- By the age of 60, most people have at least one or two of these
- They have a very distinct edge and often sit up on top of the skin, like being stuck on
- Colour varies from pale brown through to brown-orange and occasionally black. This is due to skin being trapped in crypts and becoming oxidized
- Size varies from a few millimetres to 2 cm
- Often described as warty, but they are not due to the wart virus. They are not contagious

Remember to check your skin regularly. See your doctor if you notice a freckle, mole or lump that is **NEW** or **CHANGING** in size, shape or colour; or a sore that does not heal over 4-6 weeks. Use a mirror to check hard to see spots, like your back and scalp, or get a family member, partner or friend to check for you.

This is intended as a guide only – consult your doctor regarding any concerning spots or unusual changes.
